# Appendix programme-sheet

Services suisses d'essais d'aptitude Schweizerische Eignungsprüfungsdienststellen Servizi svizzeri di prove valutative interlaboratorio Swiss proficiency testing services

# Description

This appendix is an integral part of the programme-sheets of the below listed programmes. In addition, specific and complementary directives that have to be followed for certain samples are mentioned in the specific programme-sheets (\* signed).

- Blood gas \* •
- Cardiac and tumor markers
- Cerebrospinal fluid
- Clinical chemistry \*
- Clinical toxicology
- Haematology and haemostasis \* •
- Hormonology and bone metabolism \* •
- Immunology \*

- Lyme borreliosis
- Microbioloav \*
- Parasitology toxoplasmosis serology and blood parasitology
- Photometry \*
- Porphyrins \*
- Rapid tests HIV Strep A Urine Slide Stool blood \* •
- Serum indices HIL \* •

- Urine and urine test strips \*

### **Control sample**

- Every biological material must be handled with the safety precautions established for infectious material.
- The control samples are provided for specific analysis on given devices and, unless otherwise specified, they have to be handled as patient samples.

## Storage, stability and pre-analytical

- All materials, liquid or lyophilised, must be stored in the refrigerator (2 8°C).
- The analysis must be performed as soon as possible after the reception of the control sample.
- Let the liquid samples warm up at room temperature (18 25°C) for about 30 minutes. Immediately prior to analysis homogenise by inversion or with a tube-roller, without shaking to avoid the apparition of bubbles.
- The control samples are stable at least until the validity date indicated on the label. For the real sample's expiry date, please contact the CSCQ.

# **Reconstitution of lyophilised samples**

- Let the lyophilisate and the dilution fluid, or the (bi)distillated water, warm up at room temperature 1 (18 - 25°C).
- 2. Let all the lyophilisate drop to the bottom of the vials, by gently taping the vial, if necessary.
- 3. Carefully open the vial to avoid any material lost. Let the air enter before opening the vial entirely.
- 4. Add in one single shot, using a certified pipette, the precise volume of dilution fluid, or (bi)distillated water, as indicated on the label. The dilution fluid should be gently inserted along the vials wall. Do not fill the vial with a syringe.
- 5. Reseal the vial and let rest, without shaking, 15 to 30 minutes in the dark at room temperature.
- 6. Gentle homogenise the sample avoiding the apparition of bubbles:
  - proceed to 30 inversions or
  - let 10 minutes on a tube-roller
- 7. Make sure that the entire lyophilisate is dissolved and proceed immediately to the analysis. If exceptionally the analysis cannot be performed straight away, the vial has to be preserved closed in the refrigerator (except the samples designed for the coagulation which cannot be stored).

### Remark

The reconstitution error should be < 3%. A procedure for pipettes verification can be downloaded, in French or in German, from the CSCQ Website:

(http://www.cscq.ch), under Documents / Appendices (see the desired language corresponding page).

### Specificities linked to the methods and /or devices

- It is important to carefully follow the specific recommendations made for your device.
- For any question regarding the handling of these devices, please contact your local representative.
- There are some simplified instructions in French, German and Italian, on the CSCQ Website, under Documents / Device handbooks and EQA samples manipulation (see the desired language corresponding page).

#### **Results transmission**

Transfer the results to CSCQ before the date given on the delivery note via EQAcom.

We remind the EQAcom users that, for the quantitative results, they have to choose the unit of their analytical device. The EQAcom application will register these units and will proceed, when necessary, to the conversion in SI units.

For the qualitative result, select the option corresponding to your result in the scroll menu and answer if requested to any question.

If you do not use EQAcom, please transmit your results on the results form and pay attention to the unit given by your analytical device.
